

B1
nerve cells of dorsal root ganglia derived from wild-type mice with the above-mentioned anti-
Na_v2 antibody. The size of the dispersedly isolated nerve cells were comprised of 3 groups of
small (25 micron or smaller in diameter: about 50%), medium (25 to 40 micron in diameter:
about 40%), and large (40 micron or larger in diameter: about 10%). However, there was no
difference between the materials isolated from wild-type and gene-deficient mice in the size,
shape and survival rate of these 3 types of cell. The survival rate was verified by Tripan blue
staining. —
